

- Hot water is dripping through a coffeemaker, filling a large cup with coffee. The amount of coffee in the cup at time  $t$ , from  $[0, 6]$ , is given by a differentiable function  $C$ , where  $t$  is measured in minutes. Selected values of  $C(t)$ , measured in ounces, are given in the table.

<b>t(minutes)</b>	<b>0</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>
<b>C(t) ounces</b>	<b>0</b>	<b>5.3</b>	<b>8.8</b>	<b>11.2</b>	<b>12.8</b>	<b>13.8</b>	<b>14.5</b>

t(minutes)	0	1	2	3	4	5	6
C(t) ounces	0	5.3	8.8	11.2	12.8	13.8	14.5

- Use a midpoint sum with three subinterval of equal length indicated by the data in the table to approximate the value of

$$\frac{1}{6} \int_0^6 C(t) dt.$$

$$\frac{1}{6} \int_0^6 C(t) dt = \frac{2(5.3) + 2(11.2) + 2(13.8)}{6}$$

— 10.1 ounces

t(minutes)	0	1	2	3	4	5	6
C(t) ounces	0	5.3	8.8	11.2	12.8	13.8	14.5

- Using correct units, explain the meaning of  $\frac{1}{6} \int_0^6 C(t) dt$  in the context of the problem.

The Average amount of water coming through the pot in the first 6 minutes is 10.1 ounces.
